The lymphoid disorders include lymphocytic leukaemia or chronic lymphoproliferative disorders e.g. lymphoma, myeloma or chronic lymphoid leukaemia. The myeloid disorders include chronic or acute myeloid leukaemia, e.g. angiogenic myeloid metaplasia, essential thrombocythaemia or polycythaemia vera. The invention is used in gene therapy. The present sequence is an antisense oligo targetted to HRE in the mdr1 gene (mdr1-HRE) to inhibit its expression. This oligo is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of treating a subject having or at a of developing a haematologic malignancy or multidrug resistance (MDR). The method involves administering hypoxia inducible factor-1 (HIF-1) binding molecules or small ubiquitin-like-modifier (SUMO)-1 binding molecules or Hif-1-SUMO-1 complex modulators. mdrl-hypoxia responsive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; haematologic malignancy; multidrug resistance; MDR; SUMO-1; hypoxia inducible factor-1; small ubiquitin-like-modifier; HIF-1; lymphoid disorder; chronic lymphoproliferative disorder; lymphoma; myeloid disorder; lymphocytic leukaemia; thrombocythaemia; myeloma; angiogenic myeloid metaplasia; myeloid leukaemia; gene therapy; polycythaemia vera; hypoxia responsive element; HRE; ds.

Claim 1;

tissues.

SEQ ID NO 15991; 80pp; English

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and

Complex method involves administering hypoxia inducible factor-1 (HIF-1) binding molecules or small ubiquitin-like-modifier (SUMO)-1 binding complex modulators. mdr1-hypoxia responsive complex modulators. The subject sand complex modulators are useful for treating a complex complex modulators. The lymphodid disorders complex triak of developing haematologic malignancy or MDR complex complex complex complex disorders complex comple

The probe, methods and apparatus are useful in gene CC cited above. The probe, methods and apparatus are useful in gene CC expression analysis. The probes may be used as tools for surveying CC tissues to detect the presence of expressed messages that contain their cpecific exon, or in constructing genome-derived single exon microarrays. CC in addition, the probes are used in identifying and characterising CC alterations in the genomic locus that includes their exon, in assessing cc smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The presence is a human CC single exon probe of the invention. Note: The sequence is a human cc serious unable to compare the printed specification, but was obtained considerations in the prace of the printed specification, but was obtained considerations in the present directly from USFO at the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-addressable set of single exon nucleic acid grobes for measuring human gene expression (comprising a plurality of single exon nucleic acid probes is separately and addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a method of measuring human gene expression, a method of measuring human gene expression, a method of measuring human gene expression a contiguous amino acids of any of the above-mentioned amino acid contiguous amino acids of any of the above-mentioned amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 219
                                                                                                                                                                                                                                                                                                                                                Human; probe; ss; gene expression; single exon probe; microarray; alternative splicing event; genomic alteration.

New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.

Claim 15; SEQ ID NO 2291; 80pp; English

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide encoding at least 8 amino acids of any of the 6888 amino acid sequences (fully defined in the specification, or their complements or fragments, and comprising at least 8 amino acids of any of the 6888 amino acid sequences (fully defined in the specification. The probe is a single exon probe that comprising a plurality of single exon mucleic acid molecule comparison of the probes of the specification of the probes of the specification of the plurality of single exon nucleic acid comprising at least 8 and addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a vector comprising the single exon microarray for measuring human gene expression, a method of contiguous amino acids of any of the above- mentioned amino acid contiguous amino acids of any of the above- mentioned amino acid contiguous amino acids of any of the above- mentioned amino acid contiguous amino acids of any of the above- mentioned amino acid contiguous amino acids of any of the above- mentioned amino acid contiguous amino acids of any of the above- mentioned amino acid contiguous amino acids of any of the above- mentioned amino acid contiguous amino acids of any subscription, and a computer-readable contiguous amino acid and acids of any subscription, and a computer-readable contiguous amino acid and acids of any subscription, and a computer-readable contains a database having a plurality of records (each record including data on the expression of a single exon microarrays to contiguous the probes are used in identifying and characterising contains their specification, the probes are used in identifying and characterising accordance and probes are used in identifying and characterising specifications in the genomic locus that includes their exon, in assessing allers and characterising contains a contains and characterising and characterising and i

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          altering the ATP gradient across the biological membrane of the target cell. The method is useful for modulating drug resistance of cells. It useful for increasing the sensitivity of cells to chemotheraputic and antibiotic agents and increasing resistance to herbicides. The present sequence is human Pgp ATP binding cassette (ABC) transporter coding sequence. This sequence was used in the present invention to modulate drug resistance. Note: The present sequence is not shown in the specification, but is referred to via its GenBank accession number

(I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate dosage and/or an appropriate derivative of (I). Therefore, undesirable, harmful or toxic effects are efficiently avoided. Unnecessary and potentially harmful treatment of those subjects who do not respond to the reatment with substances (nonresponders), as well as the development of drug resistances due to suboptimal drug dossing can be avoided.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) polymucleotide (II). (II) has cytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represent a sequence which is used in the exemplification of the present inventic
                                 The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTIA1 gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIA1 gene. The invention has cytostatic activity. A composition of the invention acts as a topoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glioma. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            irinotecan; cancer; UGT1A1; cytostatic; topoisomerase I inhibitor;

                                                                                                                                                                                                                                                                colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance 1 (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    lung cancer; ovarian cancer; pancreatic camultidrug resistance 1; MDR1; cytostatic;

cc variants that are all tumour-involved genes (TIGS). The nucleic acids and cc polypeptides are useful for determining the level of a nucleic acids and coplypeptide in a biological sample, for detecting a variant nucleic acid or copypeptide sequence in a biological sample, for determining the level of variant nucleic acid or polypeptide sequence in a biological sample, for determining the level of variant problems in a biological sample, for determining the level of variant problems in a biological sample and for ratio between the level of variant sequence in a composition comprising and the level of the original sequence from which the variant has been varied by alternative splicing in a second composition comprising a carrier and the nucleic acid, is useful for treating diseases (e.g. cancer) that can be ameliorated or cured by concreasing or decreasing the level of the encoded protein. The nucleic acids are also useful for diagnostic purposes, especially for detecting cancer or a predisposition to cancer, for evaluating the state or caggressiveness of cancer disease, in basic research, for understanding composition to cancer, for evaluating the state or composition to cancer, for evaluating the state or composition to cancer stages in targeting or composition to cancer stages in targeting or composition to cancer stages in which cell cycle is non-composition. The polypeptides are useful for identifying compounds capable of binding to the variant product and modulating tip activity and for modulating endothelial differentiation and proliferation, as well as to composition the coding sequences for the new variants (NV) 1-cancer and disclosed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to inhibiting expression of a target gene (I) in a cell by introducing an inhibitory RNA (dsRNA) having a double-stranded structure of at most 49 consecutive bases. At least part of one strand (as1) of dsRNA1 is complementary to (I) and at least one end of dsRNA1 has an overhang of 1-4 nucleotides. The method is used to inhibit the expression of a wide range of genes, e.g. oncogenes, cytokine genes etc. in humans, also genes in Plasmodium or in viruses or viroids that are pathogenic for humans, animals or plants. Introducing an overhang into dsRNA greatly increases effectiveness for inhibiting gene expression, both in vivo and in vitro and also increases stability and thus the effective concentration inside the cell. The present sequence is that of
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 3840 BP; 1130 A; 738 C; 957 G; 1015 T;

target genes, particularly oncogenes, cytokine genes, Id (not defined) protein genes; developmental or prion genes, or genes expressed in pathogenic organisms (particularly plasmodia) or in viruses or viroids (pathogenic in humans, animals or plants). Treating the cells with interferon greatly increases the extent to which dsRNA can inhibit expression of the target genes, and the effect is even greater when dsRNA are modified to increase their stability. ABX09936-ABX10075 represent gene fragments used to illustrate the method of the invention This invention describes a novel method for inhibiting expression of a target gene by introducing into the cell that contains the target gene elast one oligoribonucleotide (daRNAI) that has a double-stranded (da) structure of not more than 49 consecutive nucleotides (nt), where at least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon before introduction of dsRNAI. The method is used to inhibit expression of at

Inhibiting gene expression in cells, useful for e.g. treating tumors, introducing double-stranded complementary oligoRNA having unpaired γď

104pp; German.

RESULT 15
ABL91687;
ABL91687;
AC ABL916887;
AC ABL91689 ABL91797) in a complementary with the target;
AC C antisense inhibition of gene exp The invention relates to a method for inhibiting expression of a target gene (ABL91658-ABL91797) in a cell by introducing at least one oligoribonucleotide that has a double-stranded structure consisting of at most 49 sequential nucleotide pairs, with at least part of one strand complementary with the target gene and has at least one end a single-stranded sequent of 1-4 nt. The method provides oligoribonucleotides for attacked is the first of the stranded at the stranded sequent of 1-4 nt. The method provides oligoribonucleotides the stranded is the stranded sequent of 1-4 nt. The method provides oligoribonucleotides the stranded sequent of 1-4 nt. The method provides oligoribonucleotides the stranded is the stranded sequent of 1-4 nt. The method provides oligoribonucleotides the stranded sequent of 1-4 nt.

> ភិនិនិនិនិនិនិ but the oligoribonucleotides may also be directed against genes present in pathogens (e.g. Plasmodium or viruses/viroids, pathogenic on humans, animals or plants) or against cytokine, 1d, developmental or prion genes. The method provides more effective inhibition of gene expression than use of known oligonucleotides, probably because the unpaired overhang increases stability and thus intracellular concentration

 9
 Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                   Score
